| Average of other methods | 11,174,041 |  |  | 8,798,041 |  | \$ | 80.57 | Sell | -8.58\% |

## Methods 1-6: Valuation of Public Traded Companies

- Method 1: Using the Stock Price as the Basis of Valuation
- The formula to value the firm or the enterprise value (EV) is as follows:

$$
E V=M V E+D-C
$$

where EV is enterprise value, MVE is the market value of the equity, $D$ is the total debt outstanding, and $C$ is the cash and cash equivalents of the company.

- The stock price that represents the market value of each share when multiplied by the shares outstanding will give us the market value of the equity.
MVE = (SP . SO)
where MVE is the market value of the equity, SP is the stock price and SO is the shares outstanding.

## Methods 1-6: Valuation of Public Traded Companies

Method 1: Using the Stock Price as the Basis of Valuation

## METHOD \#1 - Market Value / Using the Stock Price

| Company | Symbol | Stock Price $9 / 5 / 2022$ | Stocks Outstanding (\$000) | Equity Value (\$000) | $\begin{array}{\|c} \hline \text { Debt (ST\&LT) } \\ (\$ 000) \\ 6 / 30 / 2022 \\ \hline \end{array}$ | Cash $(\$ 000)$ $6 / 30 / 2022$ | Enterprise Value $(\$ 000)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Hyatt | H | \$ 88.13 | 109,200 | 9,623,796 | 3,804,000 | 1,428,000 | 11,999,796 |

## Methods 1-6: Valuation of Public Traded Companies

- Method 2: Intrinsic Value and CAPM

The expected return is calculated by applying the capital asset pricing model (CAPM):

$$
\mathrm{E}_{\mathrm{r}}=\mathbf{R} \mathrm{f}_{\mathrm{r}}+\beta\left(\mathrm{M}_{\mathrm{r}}-\mathrm{Rf}_{\mathrm{r}}\right)
$$

where $E_{r}$ is the expected return, $R f_{r}$ is the risk-free rate, $\beta$ is the beta of the company that is analyzed, and $M_{r}$ is market return.

The formula for today's intrinsic value is

$$
v_{0}=\frac{D_{1}+\rho_{1}}{1+k}
$$

where $D_{1}$ is the dividend expected to receive within a year, $P_{1}$ is the expected stock price a year from now, and $k$ is the discount rate or expected rate of return.

## Methods 1-6: Valuation of Public Traded Companies

- Method 2: Intrinsic Value and CAPM

## METHOD \#2- Intrinsic Value

Using CAPM $=\mathrm{k}=\mathrm{Rf}+$ ( Beta ${ }^{*}$ Premium )
Risk Free (10-year Tresury) =

Beta =
Market Premium=
Market Return (Rf+Premium)=
Expected Equity Return using CAPM=
3.00\%
1.37x
5.50\%
8.50\%
10.52\%

- $\mathrm{v}_{0}=\frac{\mathrm{D}_{1}+\rho_{1}}{1+\mathrm{k}}$

$$
\mathrm{E}_{\mathrm{r}}=\mathrm{Rf}_{\mathrm{r}}+\beta\left(\mathrm{M}_{\mathrm{r}}-\mathrm{Rf}_{\mathrm{r}}\right)
$$

## Methods 1-6: Valuation of Public Traded Companies

- Method 3: Dividend Discount Model (DDM)

To calculate such value using the DDM method, the analyst needs the expected price of the stock a year from the date of the analysis, the expected dividend per share paid within the year, and a discount rate, which derived using the capital asset pricing model (CAPM).

$$
\text { - } \mathrm{V}=\frac{\mathrm{D} 1}{\mathrm{k}-\mathrm{g}}
$$

where $D_{1}$ is the expected dividend, $k$ is the discount rate, and $g$ is the expected growth rate.

## Methods 1-6: Valuation of Public Traded Companies

- Method 3: Dividend Discount Model (DDM) • V = $\frac{\mathrm{D} 1}{\mathrm{k}-\mathrm{g}}$

## METHOD \#3- Dividend Discount Model (DDM)

Constant-Growth DDM (Gordon Model) V0 = D1 / (k-g)
D1 =
\$0.76
Expected Equity Return (k)=
10.52\%

Expected Growth (g) =

Expected HPR $=E$ 9r $)=[E(d 1)+(E(p 1)-P 0) / P 0$
Dividend (d1)
P1 = P0+D
\$0.76 Pre-covid
1-PO+D \$88.89
PO \$ 88.13
Exp. HPR=
1.72\%

## Methods 1-6: Valuation of Public Traded Companies

## - Method 4: Using Comparable Trading EBITDA Multiples

## METHOD \#4 -Average EBITDA Industry Trading Multiples

| Company | Symbol | Stock Price 9/5/2022 | $\qquad$ | Equity Value (\$000) | $\begin{aligned} & \text { Debt (ST\&LT) } \\ & (\$ 000) \\ & 6 / 30 / 2022 \end{aligned}$ | $\begin{gathered} \text { Cash } \\ (\$ 000) \\ 6 / 30 / 2022 \end{gathered}$ | Enterprise Value (\$000) | $\begin{aligned} & \text { EBITDA } \\ & \text { (\$000) } \\ & \text { LTM } \\ & 6 / 30 / 2022 \end{aligned}$ | EBITDA <br> Multiple | Beta |

## Methods 1-6: Valuation of Public Traded Companies

- Method 5: Using Comparable Acquisition EBITDA Multiples

## METHOD \#5 - Using Averge EBITDA Transaction Multiples (M\&A Comparable Method)

## Method 6: DCF Valuation Analysis

To value the company using the DCF method the analyst needs to derive the following four items:

- Setting up a stream of cash flows
- Identifying an exit year
- Calculating the value at exit year (terminal value)
- Using the appropriate discount rate to value the present value of the firm

## Method 6: DCF Valuation Analysis

To value the company using the DCF method the analyst needs to derive the following four items:

- Setting up a stream of cash flows

## Method 6: DCF Valuation Analysis

To value the company using the DCF method the analyst needs to derive the following four items:

- Using the appropriate discount rate to value the present value of the firm
- WACC for Firm Value
- CAPM for Equity Value

| Cost of Equity Calculation |  |
| :--- | ---: |
| Risk Free Rate (5 year) | $3.00 \%$ |
| Premium based on MC $=$ | $5.50 \%$ |
| Hyatt Beta $=$ | 1.37 x |
| Expected Equity Return $=$ | $10.52 \%$ |
|  |  |
| Cost of Debt Calculation | $3,804,000$ |
| Avg Debt | 163,000 |
| Interest | $4.285 \%$ |
| Rate |  |

| WACC Calc: | Amount | \% Cap | RoR | AT RoR | WACC |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Total Debt | $3,978,000$ | $29.2 \%$ | $4.285 \%$ | $3.342 \%$ | $0.977 \%$ |
| MV Equity | $9,623,796$ | $70.8 \%$ | $10.521 \%$ | $10.521 \%$ | $7.444 \%$ |
| Total Cap | $13,601,796$ | $100.0 \%$ |  |  | $8.421 \%$ |

| WACC (Firm Valuation Discount Rate) | $8.421 \%$ |
| :--- | :--- |
| CAPM (Equity Valuation Discount Rate) | $10.52 \%$ |

## Method 6: DCF Valuation Analysis

| METHOD \#6 - Discount Cash Flow Valuation Analysis |  |  |  |  |  |  |  |  |  |

## Method 7: Using the Leveraged Buyout Model (LBO) Method

- While the DCF analysis is used for determining today's value of the company based on future cash flows, the value of the company using this LBO method is determined based on investor expectation, which means return determines the acquisition price of the firm.
- Building the Transactions Sources and Uses
- Setting up the Debt Schedules
- Calculating the Expected Equity Return
- Running Projections
- Determining the Terminal Value
- Determining the Value of the Firm

## Method 7: Using the Leveraged Buyout Model (LBO) Method

## Hyatt Hotels Corporation

corporate valuations
MEIHOD *7 - Leveraged Buyout (LBO) Analysis

## Valuation of Private Companies

 Applying methods 6-8
## Method 6: Discount Cash Flow Method (DCF)

- One of the most effective ways to value a private company is to dive into the company's projections and change the assumptions based on the investor's view of how the revenue will grow and at what cost.
- Since there is no stock price that trades, which gives the investor a direct indication of what the company is worth (market value), an important method used by professionals is the discount cash flow (DCF) method, which measures the company's intrinsic value.
- The conduction of this method is to calculate the first the equity cash flows, identify the exit year, estimate the terminal value in the exit year, and use the expected equity return as the discount rate.

## Valuation Analysis - Celerity Technology Inc

## Method 7: Leveraged Buyout (LBO) Method for Private Companies

## Method 8: Valuation of Distress Firms

## - Option Pricing Model Framework

- In option pricing and specifically in call options the payoff formula or intrinsic value of the option is Option payoff $=\operatorname{Max}(0, S-X)$
where $S$ is the stock price and $X$ is the exercise price.
- To calculate the enterprise value

$$
E V=E+D-C \text { or } E V=E+n e t D
$$

where EV is the enterprise value of the firm, E is the equity value, $D$ is the debt and $C$ is cash. The net $D$ is referred to as debt minus cash implied that the current debt could be paid with cash on hand.

- Solving for equity:

$$
\mathrm{E}=\mathrm{EV}-\text { net } \mathrm{D}
$$

where $E$ is the equity, $E V$ is the enterprise value and net $D$ is the net debt.

## Method 8: Valuation of Distress Firms

## - Option Pricing Model Framework

The Black-Scholes formula is

$$
\text { C option payoff }=\mathrm{Se}^{-\delta \cdot \mathrm{t}} \cdot \mathrm{~N}(\mathrm{~d} 1)-\mathrm{Xe}^{-\mathrm{i} \cdot \mathrm{t}} \cdot \mathrm{~N}(\mathrm{~d} 2)
$$

where $S$ is the stock price, $\delta$ is the dividend yield, $t$ is time until expiration, $X$ is the option exercise price, $i$ is the risk-free interest rate, and $N$ is the normal distribution.

$$
\mathrm{d} 1=\frac{\left[\ln \left(\frac{\mathrm{S}}{\mathrm{x}}\right)+\left(\mathrm{i}-\delta+\frac{\sigma^{2}}{2}\right) \cdot \mathrm{t}\right]}{\sigma \sqrt{\mathrm{t}}} \text { and d2=d1-ov} \mathrm{t}
$$

where S is the current stock price, X is the contractual exercise price, i is the riskfree interest rate, $\delta$ is the dividend yield, $\sigma$ is the standard deviation, and $t$ is time to expiration.

## Method 8: Valuation of Distress Firms

## Input:

- $\mathrm{S}=$ Value of the firm = \$1 billion
- X=Exercise price = debt value = \$1,200 million
- $\sigma=$ Standard deviation of the asset $=20 \%$
- $\mathrm{t}=$ Time $=$ term of the bond $=5$ years
- $\mathrm{i}=$ Risk-free rate $=3 \%$
- $\delta=$ Dividends = cash flow paying the equity = \$0
- $\mathrm{C}=$ Equity value $=\mathrm{E}=$ ?

## Formulas and output:

Using the formula to determine the deviations d 1 and d 2 :
$d 1=\frac{\left[\ln \left(\frac{S}{x}\right)+\left(i-\delta+\frac{\sigma^{2}}{2}\right) \cdot t\right]}{\sigma \sqrt{ } t}$ and $d 2=d 1-\sigma \sqrt{ } t$
$d 1=.7671$ and $N(d 1)=.7785$
$d 2=.5678$ and $N(d 2)=.7149$
Using the Black Sholes formula:

$$
\begin{gathered}
C=S e^{-\delta . t} \cdot N(d 1)-X e^{-i . t} \cdot N(d 2) \\
C=\$ 152.0 \text { million }
\end{gathered}
$$

## Valuation Analysis of Distress Company - AB Air Co.

- AB Air Co., an airline company that entered bankruptcy in 1990. At the time of the filing, the debt outstanding, representing the exercise price $X$, was at $\$ 600$ million with a remaining life or duration of 5 years. To establish the value of equity, the enterprise value needs to be calculated. The management put together a business plan including 5 years of projections. In the first year, the company is planning to spend more money, representing restructuring costs and downsizing. Based on the 5 years' projection, the equity analyst could calculate the present value of the future cash flows, an estimated terminal value, and an assumed discount rate using the weighted average cost of capital of $10.5 \%$.
- The DCF analysis yields an enterprise value or the value of S of $\$ 934$ million. Obviously with $\mathrm{S}=\$ 934$ million and $X=\$ 600$ million the equity is in the money. Using the Black-Scholes option pricing model the equity or the call option C is calculated at $\$ 575$ million after taking into consideration the combined variance for both debt and equity using the following formula:

$$
\sigma s b^{2}=s^{2} \cdot \sigma s^{2}+b^{2} \cdot \sigma b^{2}+2(W s \cdot W b \cdot \sigma s \cdot \sigma b) \cdot \rho
$$

where $\sigma s b^{2}$ is the combined variance of bonds and stocks, $W$ s is the percentage of stocks to total capitalization, $\sigma s^{2}$ is the stock price variance prior to bankruptcy, $W b$ is the bond outstanding as percentage of total capitalization, $\sigma b^{2}$ is the bond price variance prior to bankruptcy, and $\rho$ is the correlation between the stock and bond prices.
